Gas Engine, Operated single stage snow throwers. Two types of snow throwers are available in the market, a single stage snow thrower and a two stages snow thrower. A single stage snow thrower has an auger, made of a combination metal and plastic or hard rubber. The engine drives the auger through a series of gears, which cuts the ice by chipping and simultaneously collecting and driving it out of the engine with force, thus clearing the ice on the driveway. A single stage thrower is a self-propelling machine as it rides on snow and clears a width of 12" to 22" of ice, due to which multiple passes are needed to clear the snow in the driveway.

A Two-stage Machine Is More Powerful A two stage comes with an additional pump attached to the auger which makes a two stage machine throw churned the ice at great distance. It can throw the ice up to 45' due to the additional force provided by the pump. Although it is great fun for children to play in the falling snow, care must be taken to keep the children away from the area where the churned ice lands. The two-stage thrower is more effective as it clears 2' to 3' of snow in one pass.
